

EPOXY HOLIDAY SERVING BOARD KIT - INSTRUCTIONS

1. Protect your work surface - we advise using plastic sheeting or silicone mats.

2. Lay out materials.
 - a. Using the blue tape, seal the bottom edges of the tray, then use a razor blade to trim around the edges.

3. Combine MakerPoxy Epoxy Resin and Hardener at a 1 to 1 ratio, by volume.
 - a. Combine enough to make a few colors to use on your board.
 - b. We recommend starting with 2-3 oz. of each part for a combined 4-6 oz. total.
 - c. Stir very well for at least 3 minutes. Stir slowly to avoid bubbles, scraping the sides of the cup.

4. Divide clear epoxy into the smaller cups to add pigments.
5. Mix in the desired amount of pigment. Start with a small amount - add more, as needed, until you get the color you want.

6. Pour colored pigments onto your serving tray. You can use a heat gun to pop any bubbles and to move the resin around the board. Keep the heat gun moving to prevent overheating the resin. Make any pattern or color combination that you like! Alternate colors and manipulate them using the heat gun. Continue until you achieve the desired effect. You can always go over it again entirely or just in certain areas.
7. Allow the epoxy to fully cure for at least 36-48 hours before removing the tape along the sides and bottom. Gently heat any remaining drips and scrape off using a heat gun.

You Will Also Need (not included):

Work surface protection - plastic sheeting, scraper, and heat gun

Helpful Tips:

- * Warm your room, your resin, and your mold to at least 65°F. Cold resin or mold = bubbles in your epoxy.
- * Wear PPE as recommended in the MakerPoxy Safety Data Sheet (SDS).
